

3 REASONS TO SUPPORT A LOCAL VACCINE REACTION TRACKING SYSTEM

1. The CDC VAERS Tracking system has Failed

A Harvard Vaccine Injury Study conducted from 2007 to 2010 reveals on page 6, fewer than 1% of vaccine reactions and deaths are reported to VAERS. Doctors aren't trained to identify or report vaccine injuries and deaths. Medical Examiners aren't trained to identify or investigate vaccine deaths.

2. Without a Local Tracking System, Local Vaccine Issues are Overlooked.

The CDC VAERS System is capturing vaccine injury on a National Level at less than 1%. There is no opportunity to see a safety signal in local batches of vaccines without a transparent, fully functioning tracking system for uptake and injuries/deaths.

3. Lack of Liability Encouraged Lack of Safety Oversight

1986 National Childhood Vaccine Injury Act

PREP ACT protects Covid Vaccine Manufacturers and Distributors
There are ZERO studies determining the effects of multiple vaccines given at one time. Vaccines aren't tested for carcinogenic potential or for the potential to mutate cells, stated on every Vaccine Insert.
